

You and HTML and the World Wide Web - Course Objectives

On successful completion of this class, the student, with the aid of the appropriate reference materials, should be able to:

1. Describe the conceptual working of the Internet and the World Wide Web
2. Design, create and maintain documents coded in HTML that are destined for the World Wide Web, using these features and techniques:
 - * HyperText linking
 - * Embedded text and page style markup
 - * External Cascading Style Sheets
 - * Ordered, unordered, and definition lists
 - * Embedded images of various kinds
 - * Client-side maps
 - * Embedded multimedia objects
 - * Basic client-side scripting using ECMAScript-based scripting language JavaScript
 - * Use the Document Object Model (DOM) to access, change, insert, and delete document nodes under script control
 - * Request and gather information using forms and controls
 - * Set and retrieve cookies
 - * Create and use tables on a page
 - * Use tables to create simple graphs
 - * Dynamically modify tables under script control
 - * Use frameset techniques
3. Use Notepad as an editor
4. Install, configure, and use the FileZilla FTP client to upload documents to a web site (optional)
5. Know where and how to find additional information as needed.

Lab work will be tested just using your local browser, or optionally you can use a web server we provide, or a server you or your employer provide.

You and HTML and the World Wide Web - Topical Outline

Day One

Introduction to the Web

The Web - basic concepts

The Web and HTTP

FTP and FileZilla (optional)

Computer Exercise: Setting up for the labs 39

Introduction to Markup Languages

Overview: Markup Languages

SGML

HTML - An Introduction

The HTML, HEAD, META and TITLE elements

Computer Exercise: HTML and Unicode 75

Text Markup Elements

Element types in the body of an HTML document

Events and scripts

The BODY element

The paragraph element (P)

The headings elements (H1 - H6)

The line break element (BR)

Pre-formatted text: the PRE element

Computer Exercise: Using Block text markup 96

Links and Anchors

Introduction to Hypertext

Destination Anchors

Hyperlinks

External resource links

The A element

Link types - the Rel Attribute

The accesskey and target attributes

The LINK element

The media attribute

MIME types

Computer Exercise: Using Links and Access Keys 114

You and HTML and the World Wide Web - Topical Outline, p. 2.

Basics of HTML style

Inline style elements (B, EM, I, MARK, S, SMALL, STRONG, SUB, SUP, U)	
The style attribute	
The STYLE element	
External style sheets	
Style precedence	
Grouping elements: the DIV element	
Grouping text: the SPAN element	
Quotations: BLOCKQUOTE and Q elements	
Breaking up a page: the HR element	
A digression: Lining Up Text	
<u>Computer Exercise: Getting some style</u>	146

Day Two

Introduction to Style Sheets

Style sheets	
Style properties	
Special notes	
Cascading Style Sheets	
Style Sheets on z/OS	
<u>Computer Exercise: Using style sheets</u>	160

Lists

Styles of lists	
List bounds: OL, UL, and DL elements	
List content: LI, DT, DD elements	
Lists: example	
<u>Computer Exercise: Displaying lists</u>	176

You and HTML and the World Wide Web - Topical Outline, p. 3.

Images and maps

Included items

The Image element (IMG)

Client-side maps

The MAP element

The AREA element

Areas and coordinates

Applications of maps

Maps with block content

Computer Exercise: Images and maps 203

Objects

Introduction - A little background

The EMBED element

The OBJECT element

The PARAM element

Embedding object examples: a PDF document, another HTML page,
an image

Nested objects

Multimedia - General Comments

Should you use OBJECT or EMBED?

Summary of EMBED, OBJECT, PARAM Use

Objects: design and copyright issues

Computer Exercise: Embedding objects 226

Introduction to Client-side scripting

Scripts

DOM - the Document Object Model

Scripting - Basics

Computer Exercise: Basic Scripting 254

DOM and Scripting

Using DOM to reference Nodes

The Window Object

Computer Exercise: Extend the Basic Scripting 278

Day Three

More on scripts

The if statement

Arrays

The for statement

HTMLDocuments: additional properties and methods

Adding and deleting nodes

The SCRIPT element

Functions

Remote scripts

Computer Exercise: Expanding / Collapsing List 315

Miscellaneous Scripting Topics

The document.write() construct

Testing for browser capabilities

Computer Exercise: Using document.write() 326

Forms and INPUT controls

Introduction to Forms and Controls

The FORM element

The INPUT element (type: text, password, checkbox, radio, file, hidden, submit, reset, image, button)

Successful controls

Submit processing

Computer Exercise: Forms and INPUT controls 360

Those Other Controls

The BUTTON element

List boxes (SELECT, OPTION, OPTGROUP elements)

The LABEL element

DOM properties and methods for SELECT elements

The TEXTAREA element and DOM methods for TEXTAREA

The FIELDSET and LEGEND elements

Computer Exercise: Nobel Prize Application 400

You and HTML and the World Wide Web - Topical Outline, p. 5.

A delightful Exploration of Various Topics

- The meaning of "focus"
- Tabbing and tabindex
- Controls without forms
- Design issues

Day Four

Cookies

- The Stateless Web
- Storing State Information
- Cookie formats
- Working with cookies
- Cookies: the Good, the Bad, and the Ugly
- Cookies and your Server
- Computer Exercise: Using cookies 433

Introduction to Tables

- Table terms
- The TABLE element
- The CAPTION element
- The TR element
- The TH and TD elements
- Using Header information
- Building a table
- Computer Exercise: Enhancing a Table 467

Structuring Tables

- Grouping rows
 - The THEAD and TFOOT elements
 - The TBODY element
- Grouping columns
 - The COL element
 - The COLGROUP element
 - Grouping columns - notes
 - Calculating column widths
- Computer Exercise: Structuring a Table 482

You and HTML and the World Wide Web - Topical Outline, p. 5.

Scripting With Tables

- DOM Methods for Table-related elements
- Scripting ideas for tables
- Highlighting the contents of some cells
- The switch statement
- The break statement
- Adding a column to a table dynamically
- Computer Exercise: Updating a table dynamically 506

Frames and Framesets

- The Frameset Model
- The FRAMESET element
- Figuring row and column sizes
- The FRAME element
- Sample framesets
- Frames as targets
- Reserved target names
- The NOFRAMES element
- The IFRAME element
- Computer Exercise: A page using frames 520

Loose ends

- Accessing programs without forms
- Hiding pages - robots.txt
- Validation of HTML pages
- Change
- Design for any browser
- Design thoughts
- HTML Next - a peek at the future
- What does 'Free' mean on the Web?
- Additional studies

Websites vs. 'apps'

With all the attention these days on mobile apps (applications) one wonders if websites are a thing of the past. And with websites like FaceBook: are personal or corporate websites a thing of the past? I don't think so, for these reasons:

- ◆ **Focus - a website focuses on a particular company, organization, person, or topic; FaceBook, Instagram, SnapChat, Twitter, and the like tend to be scattershot**
- ◆ **Durability - mobile apps and apps like FaceBook tend to be ephemeral: their content changes constantly; a website provides consistency and longevity of content**
- ◆ **Structure - most apps don't have much in the way of organization or help or guidance: the developers seem to think their user interface is intuitive or obvious; a well designed web site provides clear structure and help**
- ◆ **Visibility - websites are generally designed for larger screens, apps for smaller screens; in depth information is more easily accessed with a larger screen**

Local Websites

Most, if not all, browsers allow you to open a local file. This means you can view your web pages on your PC or Mac without having to have a remote web server. This is great for development and testing. Not all features can be tested this way, but all the content of this course can be tested locally. Our labs are set up to support testing your website locally or on a remote server.

Notes on Standards

Although there is more detail in the Appendices, it might help to keep these few points in mind:

1. The World Wide Web Consortium (W3C) establishes Web oriented standards. The process for a standard to be established is basically this: a Working Group with a charter publishes a document called a Request For Comment (RFC). This RFC is then reviewed and goes through a consensus building process that hopefully ends up with the RFC becoming a Recommendation. This is the W3C term for an internet standard.

The official list of current W3C standards and drafts is found at:

<http://www.w3.org/TR/>

2. Another group was formed in 2004 that has become quite important in the web standards area: Web Hypertext Application Technology Working Group (WHATWG). This group was founded by employees of Apple, Mozilla, and Opera when they became concerned that W3C was not developing HTML any further and instead focusing on XHTML. After some time, the W3C working group on XHTML was disbanded and W3C indicated an interest in working with WHATWG on HTML 5. Both groups now consult on the process. WHATWG does not publish a standard, but a specification that they call a "Living Standard" because it continues to grow and change.

The WHATWG Living Standard is always very similar to the W3C HTML 5 standard and may be found here:

<http://www.whatwg.org/specs/web-apps/current-work/multipage/>

3. The Internet Engineering Task Force (IETF) establishes standards for internet infrastructure related protocols, such as TCP, HTTP, IP, and many others. IETF also uses the term RFC, and has a process for an RFC to become a Standard.

The official list of current IETF standards is at:

<http://www.rfc-editor.org/standards>

Notes For the Course

Since this is a first course in HTML (HyperText Markup Language), the intent is that labs should be done using a simple text editor. That is, do not use any of the editors on the market that are designed explicitly for HTML.

These commercial HTML editors let you create HTML quickly, but they have two drawbacks: 1) they hide your work from you (that is, they focus on the presentation and not the markup) and 2) they insert lots of unnecessary markup (such as self-promotional comments / notes).

When testing production HTML, you should test using as many browsers as possible. There is no shortage of free browsers available on the Internet. Examples in these courses were tested in Mozilla Firefox, Opera, Google Chrome, and Microsoft Edge.

Browser versions change quickly, but we felt it was important to have a consistent test base throughout this course.

This course is based on the W3C standards for HTML and DOM as well as the ECMA-international standard for ECMAScript (also known as JavaScript), and is intended to be browser-independent. That is, we try to avoid teaching any features only available for specific browsers.

Historically, HTML was released in waves, so version 2, version 3, version 4, etc. Now, the W3C is working on new versions of CSS (Cascading Style Sheets, CSS 3) and HTML (HTML 5), and DOM (the Document Object Model, DOM 4). These standards are dynamic. We have added notes that reflect the thinking going into these standards at the current time throughout the course.

There is a similar language available called XHTML (eXtensible HyperText Markup Language) that was very popular for a while but it has not replaced HTML as people once thought it might. We mention this in passing from time to time but it is of no real interest here.
